

15.3 Input System

Osama Al-Zoabi

In this document, you can see a few new inputs I added into my unity capstone project, Cosmo cargo. I have decided on a few critical inputs for implementation into the game structure since this is a board game with a sizable setup (including two boards):

- Roll Dice: by using the enter key, the player can roll the dice for a multitude of actions in the game settings such as movement and aptitude rolls to aid in scoring asset points from events. I used enter because the key implies entering, or committing, to a decision in regards to the content and context of the game stage.
- Move screen view: this is meant to navigate the games two boards to determine player locations and observe any updates to their movement or items they've gathered (cards,etc.). I picked the WASD keys because it's the most common movement buttons across the industry.
- Zoom in/out screen: this button is to zoom into the screen to more discreetly find board tokens in play. I chose the control key because it's far enough from the WASD keys to be used separately and with the same hand.

I could add the arrow keys for movement, spacebar for rolling the dice, and perhaps add in inherent UI to pause the game, inspect cards, or open a leaderboard during the match.
